Analyzing Application Logging

Going Native

Conclusion

**Troubleshooting** 

# Troubleshooting

### Git issues

Possible Git/Github issues you may face when setting up your DevWorkspace.

## Wrong git credentials

You DevWorkspace is configured to use Git cache store to avoid git to ask for your git credentials every time you try to push a change to your repo.

When doing a git push, if you get any authentication error due to a wrong token, you can invalidate/clean up the local git credentials cache by executing the following command in a Terminal:

```
git config --global --unset credential.helper
git config --local --unset credential.helper
```

### SHELL

#### Github Password authentication

If you tried to authenticate against Github using your account password you should see an error message like this when trying git push:

remote: Support for password authentication was removed on August 13, 2021. remote: Please see https://docs.github.com/en/get-started/getting-started-with-git/about-remoterepositories#cloning-with-https-urls for information on currently recommended modes of authentication. fatal: Authentication failed for 'https://github.com/your-gb-account/rhsummit2023-java-performancemonitoring.git/'

In this case you need to invalidate the git cache store by executing:

```
git config --global --unset credential.helper
git config --local --unset credential.helper
```

SHELL

and use a Personal Access Token instead of your account password. See setup section to setup a Personal Access Token in your Github Account.

## Git push rejected

If your git push fails with a similar message like this:

```
SHELL
workshop-performance-monitoring-apps (main) $ git push
To\ https://github.com/your-github-account/rhsummit 2023-workshop-performance-monitoring.git and the property of the propert
                                                                                           main -> main (non-fast-forward)
   ! [rejected]
error: failed to push some refs to 'https://github.com/your-github-account/rhsummit2023-workshop-performance-
hint: Updates were rejected because the tip of your current branch is behind
hint: its remote counterpart. Integrate the remote changes (e.g.
hint: 'git pull ...') before pushing again.
```

It may happen the Workshop Template repo got updated recently (after our lab environment got created) and is not in-sync with your fork. To solve this issue just do the following before you can push your changes:

```
git pull --rebase
```

Now you should be able to do a git push your changes!

# Git push get stuck

If your git push get stuck without asking for your credentials.

Try to invalidate/clean the git cache store configuration and set the origin remote url explicitly passing your github account name

git remote set-url origin https://YOUR-ACCOUNT-NAME-HERE@github.com/YOUR-GIT-ACCOUNT-HERE/rhsummit2023-workshopperformance-monitoring.git

Now you should be able to do a git push and see a prompt asking for your credentials.

hint: See the 'Note about fast-forwards' in 'git push --help' for details.
